GIT · GITHUB

Git vs GitHub

Git is the tool that tracks your code on your computer. GitHub is the website where you store and share it.

SIDE BY SIDE

ASPECT	GIT	GITHUB
What it is	A tool (software)	A website / service
Where it lives	On your computer	On the internet
Needs internet?	No	Yes
What it does	Tracks changes and saves the project history	Hosts repositories and makes teamwork easier
Who made it	Linus Torvalds (2005)	GitHub, Inc. (now owned by Microsoft)

GOOD TO KNOW

- You can use **Git without GitHub**, but you cannot use GitHub without Git.
- GitHub has alternatives such as **GitLab** and **Bitbucket**. All of them work with the same Git commands.
- **Analogy:** Git is like Word saving versions of a file on your computer. GitHub is like Google Drive, where you upload the file to share it.

WHERE EACH COMMAND RUNS

COMMAND	RUNS ON	WHAT IT DOES
`git init`	**Git, on your computer**	Starts a new repository in the folder
`git add .`	**Git, on your computer**	Stages all changes for the commit
`git commit -m "first commit"`	**Git, on your computer**	Saves a snapshot on your computer
`git push`	**Git to GitHub**	Sends your commits to GitHub

The first three commands never touch the internet. Only `git push` sends your work to GitHub.
